Next: ASV 4.3, 4.4

Week 6: Homework 5 (due Sunday, Feb 14)

Poisson Approximation of Binomial

Fix $\lambda > 0$. For each n , let $T_n \sim \text{Bin}(n, \lambda/n)$.

For any fixed $k \in \mathbb{N}$,

$$\lim_{n \rightarrow \infty} P(T_n = k) = e^{-\lambda} \frac{\lambda^k}{k!}$$

In particular, for $a \leq b$ positive numbers,

$$\lim_{n \rightarrow \infty} P(a \leq T_n \leq b) = \sum_{\substack{a \leq k \leq b \\ k \in \mathbb{N}}} e^{-\lambda} \frac{\lambda^k}{k!}.$$

Normal Approximation of Binomial

Fix $p \in (0, 1)$. For each n , let $S_n \sim \text{Bin}(n, p)$.

For any fixed $a \leq b$,

$$\lim_{n \rightarrow \infty} P\left(a \leq \frac{S_n - np}{\sqrt{np(1-p)}} \leq b\right) = \int_a^b \frac{1}{\sqrt{2\pi}} e^{-x^2/2} dx.$$

$\Phi(b) - \Phi(a)$

//

Question:

A fair 20-sided die is tossed 400 times.

We want to calculate the probability that a 13 came up at least 25 times. We should use:

- (a) Poisson Approximation.
 - (b) Normal Approximation.
 - (c) Either.
 - (d) Neither.
-

$$T \sim \text{Bin}(400, \frac{1}{20})$$

$$P(T \geq 25) = 1 - P(T \leq 24)$$

$$= 1 - \sum_{k=0}^{24} \binom{400}{k} \left(\frac{1}{20}\right)^k \left(\frac{19}{20}\right)^{400-k}$$

$$= 15.10\%$$

12.57%

11.

$$1 - \left(\Phi\left(\frac{25}{\sqrt{19}}\right) - 0 \right)$$

11

$\frac{1}{\sqrt{19}}$

$$1 - \int_{-\infty}^{\frac{1}{\sqrt{19}}} \frac{1}{\sqrt{2\pi}} e^{-x^2/2} dx$$

Poisson: $n = 400, \lambda = 20$

$$P(T \geq 25) = 1 - P(T < 25)$$

$$= 1 - \sum_{k=0}^{24} P(T=k)$$

$$\approx 1 - \sum_{k=0}^{24} e^{-20} \frac{(20)^k}{k!}$$

$$= 15.68\%$$

Normal Approx $E(T) = 400 \cdot \frac{1}{20} = 20$

$$\text{Var}(T) = 400 \cdot \frac{1}{20} \cdot \frac{19}{20} = 19$$

$$\Rightarrow P(T \geq 25) = 1 - P(T < 25)$$

$$= 1 - P(T - 20 < 5)$$

$$\leftarrow = 1 - P\left(\frac{T-20}{\sqrt{19}} < \frac{5}{\sqrt{19}}\right)$$

$$\left. \begin{array}{l} T \sim \\ \text{Bin}(400, \frac{1}{20}) \\ \text{Bn}(n, \lambda/n) \end{array} \right\}$$

E.g. A fair die is rolled 720 times. What is the probability that exactly 113 sixes come up?

$$S = \#\text{sixes} \sim \text{Bin}(720, \frac{1}{6}). \quad P(S=113) = \binom{720}{113} \left(\frac{1}{6}\right)^{113} \left(\frac{5}{6}\right)^{607} \approx 3.184\%$$

Normal Approximations:

$$\mathbb{E}(S) = 720 \cdot \frac{1}{6} = 120 \quad \text{Var}(S) = 720 \cdot \frac{1}{6} \cdot \frac{5}{6} = 100$$

$$\begin{aligned} P(S=113) &= P(113 \leq S \leq 113) = P\left(-0.7 \leq \frac{S-120}{\sqrt{100}} \leq -0.7\right) \stackrel{\approx}{=} \Phi(-0.7) - \Phi(-0.7) \\ &= P(112.5 \leq S \leq 113.5) = P\left(-0.75 \leq \frac{S-120}{10} \leq -0.65\right) \\ &\quad \uparrow \\ &= \Phi(-0.65) - \Phi(-0.75) \\ &\approx 3.122\% \end{aligned}$$

"Continuity correction!"

$$\begin{aligned} P(k_1 \leq S \leq k_2) &= P\left(k_1 - \frac{1}{2} \leq S \leq k_2 + \frac{1}{2}\right) \approx \Phi\left(\frac{k_2 + \frac{1}{2} - np}{\sqrt{np(1-p)}}\right) \\ &\quad - \Phi\left(\frac{(k_1 - \frac{1}{2}) - np}{\sqrt{np(1-p)}}\right) \end{aligned}$$

What is \mathbb{E} ?

4.2

Precise definition: $\mathbb{E}(X) = \sum_k k \cdot P(X=k)$

Intuition: Sample X independently many times, Compute the average.

Binomial $S_n \sim \text{Bin}(n, p)$ $\mathbb{E}(S_n) = np$

$X_1 + \dots + X_n$, $X_j \sim \text{Ber}(p)$ $\mathbb{E}(X_j) = p$. $\mathbb{E}\left(\frac{S_n}{n}\right) = \frac{np}{n} = p$

Theorem (Law of Large Numbers for Bernoulli Trials)

Let X_1, X_2, \dots, X_n be independent Bernoulli trials with success probability p . Then " $\frac{X_1 + \dots + X_n}{n} \rightarrow p$ as $n \rightarrow \infty$ "

Precisely: For any $\varepsilon > 0$,

$$\lim_{n \rightarrow \infty} P\left(\left|\frac{S_n}{n} - p\right| < \varepsilon\right) = 1$$

If $S_n \sim \text{Bin}(n, p)$ (p fixed), and $\varepsilon > 0$,

$$\lim_{n \rightarrow \infty} P\left(\left|\frac{S_n}{n} - p\right| > \varepsilon\right) = 0.$$

Proof:

$$\frac{S_n}{n} - p = \frac{S_n - np}{n} \cdot \frac{\sqrt{np(1-p)}}{\sqrt{np(1-p)}} = \frac{S_n - np}{\sqrt{np(1-p)}} \cdot \frac{\sqrt{n(p)(1-p)}}{n}$$

$\downarrow \mathcal{N}(0, 1)$

$\frac{\sqrt{p(1-p)}}{\sqrt{n}}$

$$P\left(\left|\frac{S_n}{n} - p\right| < \varepsilon\right) = P\left(\left|\frac{S_n - np}{\sqrt{np(1-p)}}\right| < \underbrace{\frac{\varepsilon}{\sqrt{p(1-p)}} \cdot \sqrt{n}}_{\text{large #.}}\right)$$

Pick your favorite large R . Find some n_0 s.t.

$$\mathcal{N}(0, 1) \quad \frac{\varepsilon}{\sqrt{p(1-p)}} \sqrt{n_0} > R.$$

$$\approx P(|X| < R) \rightarrow 1 \quad \text{as } R \rightarrow \infty. \quad //$$

Example

Flip a fair coin n times. How does

$$\lim_{n \rightarrow \infty} P\left(\frac{\# \text{Heads}}{n} > 50.01\%\right) = Q.$$

behave as $n \rightarrow \infty$?

Suppose after 10,000 flips, there are 5,001 Heads.
Should we doubt that the coin is really fair?

What if, after 1,000,000 flips, there are 500,100 Heads.
Now how confident should we be that the coin is really fair?

$$P\left(\frac{S_n}{n} \geq \frac{1}{2} + \varepsilon\right) = P\left(\frac{S_n - \frac{1}{2}n}{\sqrt{n \cdot \frac{1}{2} \cdot \frac{1}{2}}} \geq 2\varepsilon\sqrt{n}\right) \approx P(X \geq 2\varepsilon\sqrt{n})$$

\uparrow
 $\varepsilon = 0.01$

$N(0, 1)$
